IPL Treatments

Pigment Removal

Light is released in short pulses that are readily absorbed by the high concentration of melanin found within pigmented lesions. The rapid absorption of light energy heats the melanin and causes the destruction of the melanin-rich cells, whilst causing minimal damage to the surrounding skin tissue.

Skin Rejuvenation

Precisely controlled short pulses of light are released that target discolouration (brown and red lesions) to create a more youthful, even complexion. In addition the light stimulates the fibroblast cells, increasing the production of new collagen and elastive. This improves the texture of the skin, tightens pore size whilst reducing the appearance on lines and wrinkles.

Red Vein Removal

Light energy is applied to the skin where it is readily absorbed by blood vessels, heating them to a point where they are destroyed. Following treatment, the vessels quickly clear as they are reabsorbed by the body, leaving little or no trace of the original lesion.

Acne

The light emitted from the IPL system directly targets over active sebaceous glands, greatly reducing the total number and severity of active lesions, whilst lessening the inflammation and occurrence of break outs. The light stimulates the production of new collagen to improve skin texture, and can also reduce the appearance on red and brown areas of the skin that are often associated with acne.

Hair Removal

The light is selectively absorbed by the melanin or pigment in the hair follicle. The light emerges then heats the pigment and effectively destroys the hair follicle without damaging the surrounding cells.

Consultation

An initial consultation is required prior to the starting of any IPL treatments. A thorough explanation of treatment will be carried out, as well as obtaining life style and medical history in order to assess suitability.

Consultations are £30, which is then redeemable off of first treatment. Treatment prices are given on consultation.

Appointments are not always necessary.
